

ABSTRACT OF THE DISCLOSURE

A system, method and carrier medium for communicating between a Financial
5 Service Organization (FSO) computer system and a computer system external to the FSO
in a generic fashion. For each direction of a message (i.e., outbound from the FSO
computer system or inbound to the FSO computer system), two templates are constructed
and subsequently stored in a database. The first type of template is the message template;
the second type of template is the message layout template. The outbound message
10 template represents outbound messages; the inbound message template represents
inbound messages. The outbound message layout template represents outbound message
layouts; the inbound message layout template represents inbound message layouts. An
outbound message represents a request for FSO data from an external computer system to
be used in a FSO computer system for processing a FSO transaction between a FSO and a
15 FSO customer. An inbound message represents a receipt of FSO data from an external
computer system to be used in the FSO computer system for processing a FSO
transaction between a FSO and a FSO customer. The corresponding message layouts
represent graphical presentations of the outbound and inbound messages. A strategy
design template represents a process for processing the FSO transaction between the FSO
20 and the FSO customer. A first channel template represents a first channel wherein the
first channel represents a means for transmitting data to and from the external computer
system.
